git commit

git push

Git

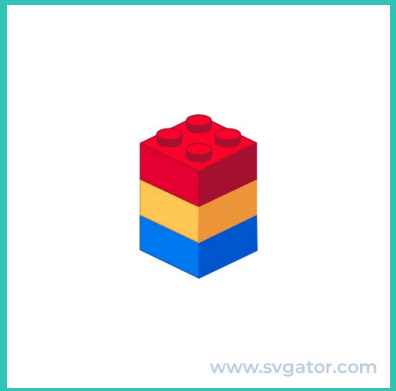
Git pull origin master –allow-unrelated-histories:

When there is a conflict between files that two people are placing in the same repository and the **FATAL** error appears.

First Pull and then Push

Build

This file compiles and archives your plug-in source code into a single JAR file. The build.properties file controls what goes into your plug-in distribution.



Build Money Bank

```xml
<project name="MoneyBank" default="jarfile">
    <!-- Initialize build properties  -->
    <target name="init" description="Initializes properties">
        <property name="project.name" value="MoneyBank" />
        <property name="src.dir" value="src" />
        <property name="main.class" value="org.academiadecodigo.bootcamp.MoneyBank.Main" />
        <property name="build.dir" value="build" />
        <property name="classes.dir" value="${build.dir}/classes" />
    </target>

    <!-- Creates the build directories to hold JAR and Class files -->
    <target name="prepare" description="Creates the build and classes directories" depends="init">
        <mkdir dir="${classes.dir}" />
    </target>

    <!-- Removes the build directory -->
    <target name="clean" description="Clean up project" depends="init">
        <delete dir="${build.dir}" />
    </target>

    <!-- Compiles the source code -->
    <target name="compile" description="Compiles the source code" depends="prepare">
        <javac srcdir="${src.dir}" destdir="${classes.dir}"/>
    </target>

    <!-- Creates a JAR file -->
    <target name="jarfile" description="Archives the code" depends="compile">
        <jar destfile="${build.dir}/${project.name}.jar" basedir="${classes.dir}">
            <manifest>
                <attribute name="Main-Class" value="${main.class}" />
            </manifest>
        </jar>
    </target>
</project>
```

MoneyBank

Project

Difficulties:

Understand how to put into code what I thought.

How to make classes communicate with each other

How to figure out what syntax to use:

- if public or private
- if void or not

Money Bank - Wallet

```
public class Wallet {

    private int walletMoney;

public Wallet (int putWallet, int takeWallet){
    walletMoney = putWallet - takeWallet;
    System.out.println("I have " + walletMoney + " in my Wallet");
}
public void addMoney(int addMoney){
    walletMoney = walletMoney + addMoney;
}
public int getWalletMoney(){
    return walletMoney;
}
public void takeWalletMoney(int money){
    walletMoney = walletMoney - money;
}
}
```

Money Bank - Piggy

```
public class PiggyBank {
    private int piggyMoney;

public PiggyBank (int putBank, int takeBank){
   piggyMoney = putBank - takeBank;
    System.out.println("I have " + piggyMoney + " in my Piggy");
}

public void addMoney(int moneySave){
    piggyMoney = piggyMoney + moneySave;
}
public int piggyMoney(){
    return piggyMoney;
}
}
```

Money Bank - Person

```
public class Person {
    private String name;

    public Wallet wallet = new Wallet(0,0);
    public PiggyBank piggy = new PiggyBank( 0,0);

public Person (String name){
    this.name = name;
}
```

Money Bank - Person

```
public void spendMoney(int money){
    wallet.takeWalletMoney(money);
    //wallet.takeWalletMoney() = wallet.getWalletMoney() - money;
    System.out.println(name + " spend " + money + ". And have " + wallet.getWalletMoney() +  " in the
Wallet");
    System.out.println("Wallet now has " + wallet.getWalletMoney() + "€ in the wallet");
}
public void saveMoney(int moneySave){
    //piggy.piggyMoney = piggy.piggyMoney + moneySave;
    piggy.addMoney(moneySave);
    System.out.println(name + " save " + moneySave + " in the piggy");
    System.out.println("Piggy now has " + piggy.piggyMoney());
}

public void fillWallet(int moneyFill){
    wallet.addMoney(moneyFill);
    //wallet.walletMoney = moneyFill + wallet.walletMoney;
    System.out.println(name + " put " + moneyFill + " in the wallet");
    System.out.println("Wallet now has " + wallet.getWalletMoney());
}
}
```

Money Bank - Main

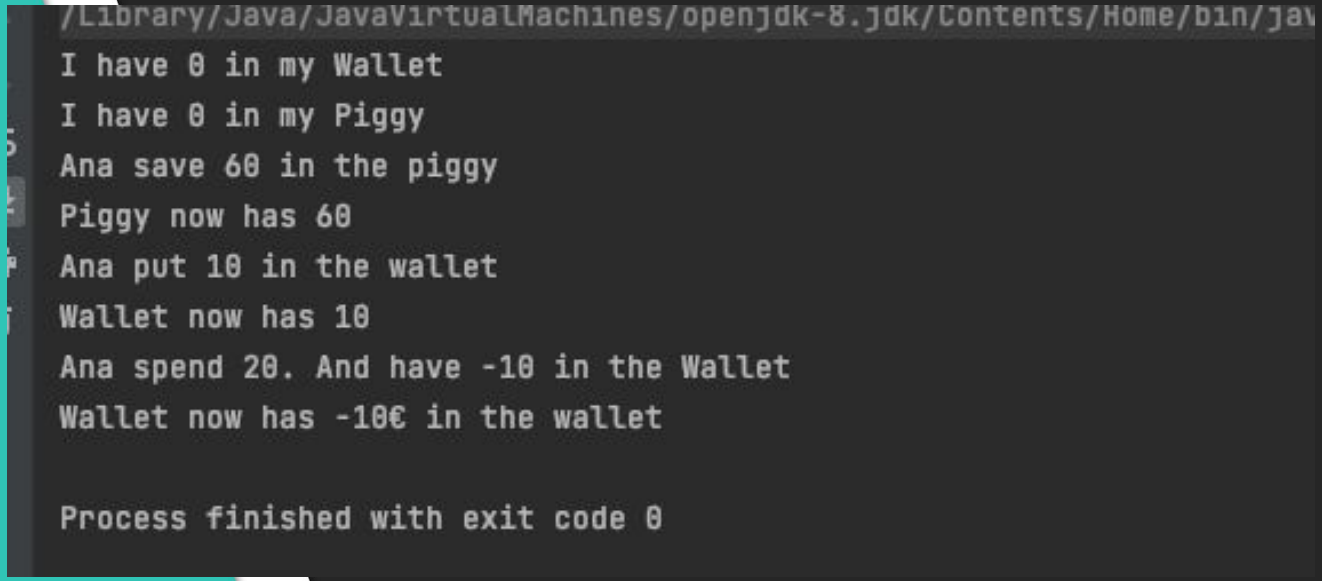
```
public class Main {
    public static void main(String[] args) {

        Person person = new Person("Ana");

        person.saveMoney(60);
        person.fillWallet(10);
        person.spendMoney(20);

    }
}
```

Money Bank



/Library/Java/JavaVirtualMachines/openjdk-8.jdk/Contents/Home/bin/jav
I have 0 in my Wallet
I have 0 in my Piggy
Ana save 60 in the piggy
Piggy now has 60
Ana put 10 in the wallet
Wallet now has 10
Ana spend 20. And have -10 in the Wallet
Wallet now has -10€ in the wallet
Process finished with exit code 0

Thank you!!
