

Zen Of Python

That was easy...

```
System.out.print("Ricardo G. @  
Academia de Código")
```

THIS DOESN'T MATTER

```
public presentation amIReallyWritingThisMethodFFS() {  
    If (!thinkAboutIt && !!practiceIt) {  
        return SPEAKER.fillUpTheChorises();  
    }  
}
```

Tim Peters

```
patrickPhalen.email = (...) the more I  
use and learn about the language, the more I  
find myself appreciating the nice balance and  
heft Guido gave to it. Yet there doesn't seem  
to be a single document that sums up that  
"aesthetic,"(...)
```

```
timPeters.email = Eh? I make shit up as  
I go along(...)
```

“

"There you go: 20 Pythonic
Fec^H^H^HTheses on the nose,
counting the one I'm leaving for
Guido to fill in."

By Tim Peters

It's like *froot loops* in **HERE**

01

Don't let your code
look like **bolo rei**

02

If you can **KISS**, do it
till you can't

03

Don't go **Breaking Bad**
unless you need to

04

If life gives you
lemons, **make lemonade**

05

The apps you need to
stay focused are **no
apps.**

06

Trust me, **I'm an
engineer**

01 DON'T LET YOUR
CODE BE **BOLO** REI

```
public class UglyPoker {  
  
    public String card1;  
    public String card2;  
    public String card3;  
    public String card4;  
    public String card5;  
  
    public UglyPoker(String p1, String p2, String p3, String p4, String p5) {  
        this.card1 = p1;  
        this.card2 = p2;  
        this.card3 = p3;  
        this.card4 = p4;  
        this.card5 = p5;  
    }  
  
    public boolean doCompareHC(String p1, String p2, String p3, String p4, String p5) {  
        String hc = "s02";  
        ArrayList<String> o = new ArrayList<String>();  
        ArrayList<String> m = new ArrayList<String>();  
        for (int i = 0; i < o.size(); i++) {  
            String mc = m.get(i);  
            for (int j = 0; j < o.size(); j++) {  
                String oc = m.get(j);  
                if (Integer.valueOf(oc.substring(1)) > Integer.valueOf(mc.substring(1))) {  
                    if (Integer.valueOf(oc.substring(1)) > Integer.valueOf(hc.substring(1))) {  
                        hc = oc;  
                    }  
                } else {  
                    if (Integer.valueOf(mc.substring(1)) > Integer.valueOf(hc.substring(1))) {  
                        hc = mc;  
                    }  
                }  
            }  
        }  
        return m.contains(hc);  
    }  
}
```

01

Beautiful is
better than ugly.

Sparse is better
than dense.

Readability
counts.

```
public class SimpleSum {  
    public static int sum(int a, int b) {  
        return a + b;  
    }  
}
```

```
public class SimpleSum{public static int sum(int a,int b){int c;c=a+b;return c;}}
```

02 IF YOU CAN KISS, DO
IT TILL YOU CAN'T

02

Simple is better
than complex.

Complex is better
than complicated.

```
public class SimpleSquare {  
    public static int square(int x) {  
        return x * x;  
    }  
}
```

```
public class ComplexSquare {  
    public static int square(int x) {  
        int result = x * x;  
        if (result < 0) {  
            System.out.println("Input must be non-negative");  
        }  
        return result;  
    }  
}
```

```
public class ComplicatedSquare {  
    public static int square(int x) {  
        int result = 1;  
        for (int i = 0; i < x; i++) {  
            result = result * x;  
        }  
        if (result < 0) {  
            System.out.println("Input must be non-negative");  
        }  
        return result;  
    }  
}
```

03

DON'T GO BREAKING
BAD UNLESS YOU
NEED TO

03

Special cases
aren't special
enough to break
the rules.

Although
practicality
beats purity.

Flat is better
than nested.

Namespaces are
one honking
great idea --
let's do more
of those!

```
public static int factorialNested(int n) {  
    if (n == 0) {  
        return 1;  
    } else {  
        int result = 1;  
        for (int i = 1; i <= n; i++) {  
            result *= i;  
        }  
        return result;  
    }  
}
```

```
public static int factorialFlat(int n) {  
    int result = 1;  
    for (int i = 1; i <= n; i++) {  
        result *= i;  
    }  
    return result;  
}
```

04 IF LIFE GIVES YOU , MAKE LEMONADE

04

Explicit is
better than
implicit.

In the face of
ambiguity,
refuse the
temptation to
guess.

Errors should
never pass
silently.

Unless
explicitly
silenced.

Python has the ZoP embedded in the language and it can be called into a Python program by using “import this”.

05

THE APPS YOU NEED
TO STAY FOCUSED
ARE NO APPS.

05

There should be
one-- and
preferably only
one --obvious
way to do it.

Although that
way may not be
obvious at
first unless
you're Dutch.

Now is better
than never.

Although never
is often better
than right now.

Guido von ROSSUM

06

TRUST ME, I'M AN
ENGINEER

06

If the
implementation is
hard to explain,
it's a bad idea.

If the
implementation is
easy to explain,
it may be a good
idea.

RICK ASTLEY

NEVER GONNA
GIVE YOU UP

THANK
YOU!

Do you have any questions?
