O O P (Object-Oriented Programming)

Is a programming paradigm.

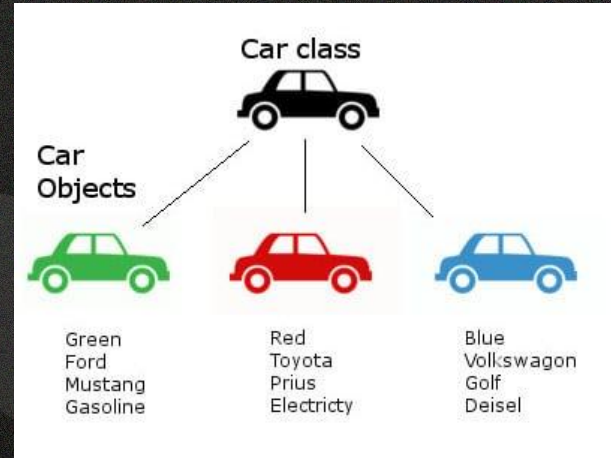

It allows for the creation of more organized and readable programs.

What is an object?

An object is an instance of a class.

It is composed of properties (attributes) that describe its state and methods that describe its behavior.

For example, an object "car" may have attributes such as color, brand, and year, and methods such as start, accelerate, and brake.

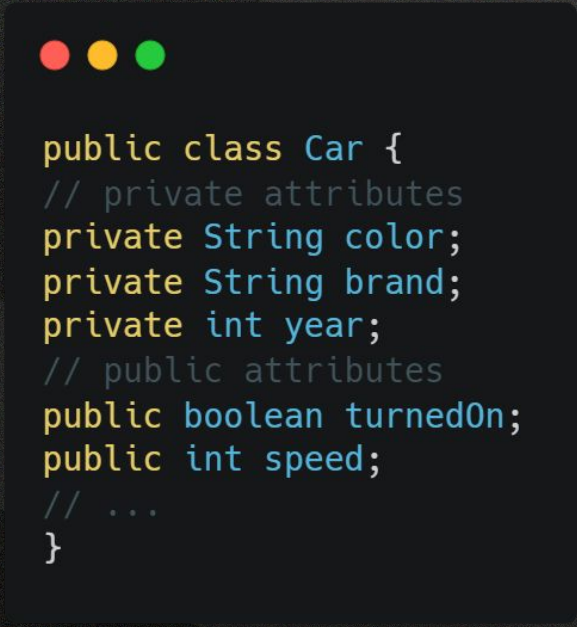

Defining properties

The properties (attributes) of an object are defined as variables within the class.

They can be declared as private or public.

In the example of a car, the properties may be "color", "brand", and "year".

```
public class Car {  
    // private attributes  
    private String color;  
    private String brand;  
    private int year;  
    // public attributes  
    public boolean turnedOn;  
    public int speed;  
    // ...  
}
```

Accessing and modifying properties

It is common to create accessor (getter) and modifier (setter) methods to allow for safe access and modification of the attributes.

This ensures safety and organization of the code. In the example of a car, the getter and setter methods may be "getColor()" and "setColor()" respectively.

SILVÉRIO COFFEE

```
public static void main(String[] args) {  
  
    SilverioCoffee coffee = new SilverioCoffee();  
  
    String result = coffee.add("milk");  
    String resultDrinks = coffee.drinks();  
    int numOfCookie = coffee.numOfcCookies(4);  
  
    System.out.println(result);  
    System.out.println("We have " + resultDrinks + " too");  
    System.out.println("You will receive " + numOfCookie + " Cookies!!");  
  
}  
}
```

```
public class SilverioCoffee {  
  
    public String justCoffee = "Coffee";  
    public int cookie;  
  
    public String add(String justCoffee) {  
  
        if (!justCoffee.equals("Coffee")) {  
            return "JUST COFFEEEEEE!!!!!!";  
        }  
        return "Coffee";  
    }  
  
    public String drinks() {  
        String beer = "Beer";  
        String water = "Water";  
        return beer + " and " + water;  
    }  
  
    public int numOfcCookies(int cookie) {  
        return cookie;  
    }  
  
}
```

Conclusion

Thank you for watching this presentation, but please do not ask questions, I know you didn't understand anything.
