1957

**Sure I'll attend
Chemistry!**

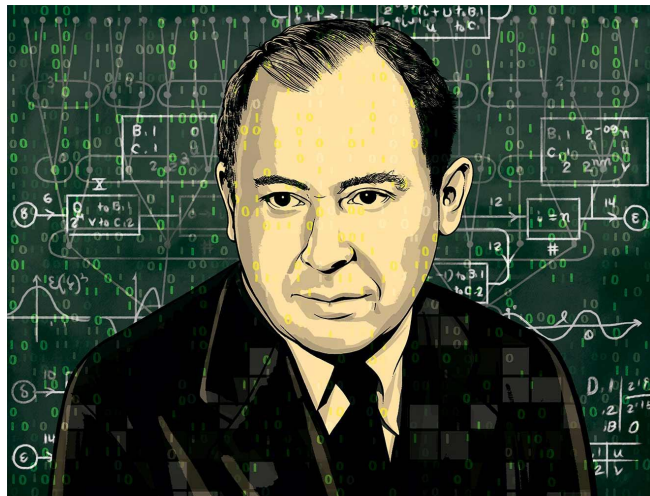

I can, and will get
my PhD in maths
at the same
time..pfff

Chemistry

Computer science

Physics

Economics

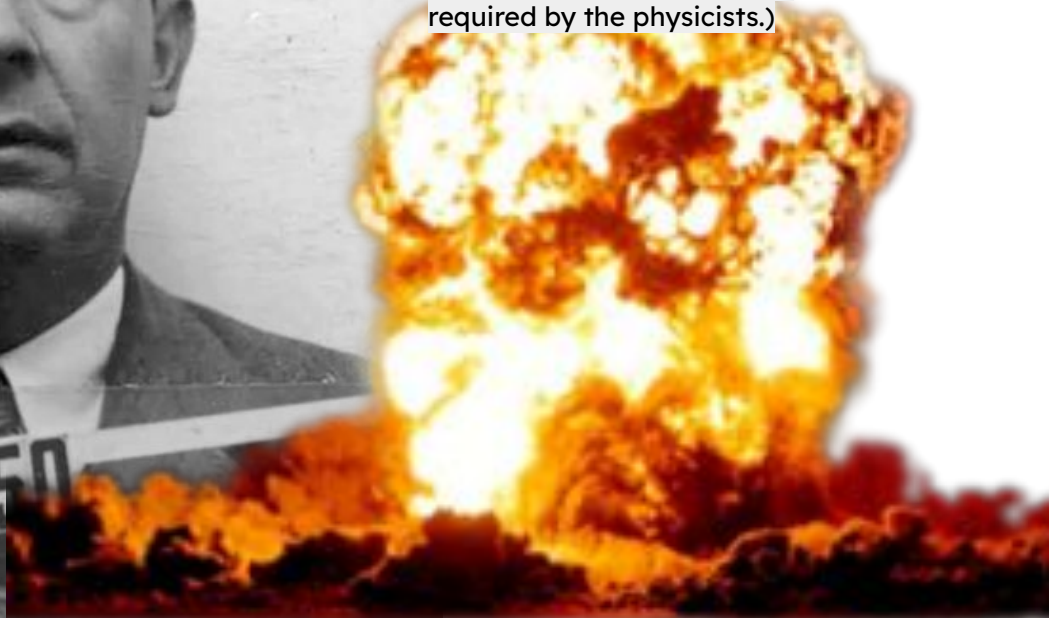

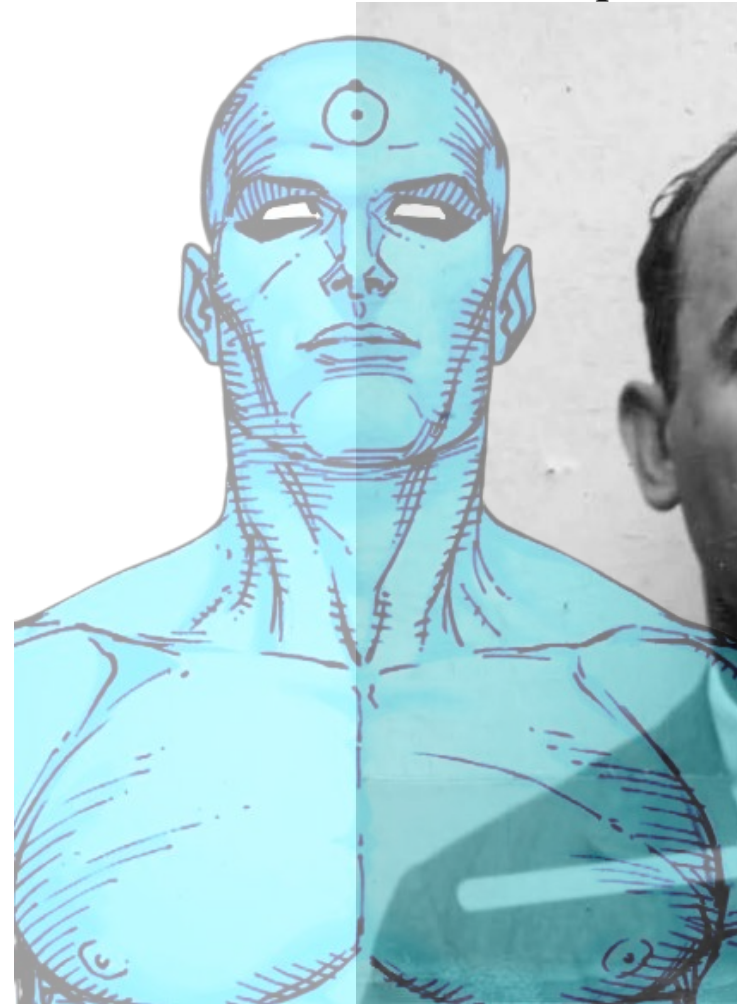

Mathematics

Neumann, pioneered new areas of pure mathematics that today bear his name; revolutionized the foundations of **quantum mechanics** in the 1920s; solved the crucial problem of employing high explosives to precisely and symmetrically compress a sphere of plutonium in the first **atomic bomb**; co-authored the bestselling book that launched the field of **game theory**; developed key concepts of nuclear deterrence and (before the first stored-program digital computer even existed) conceived the fundamental **architecture used in every computer since.**

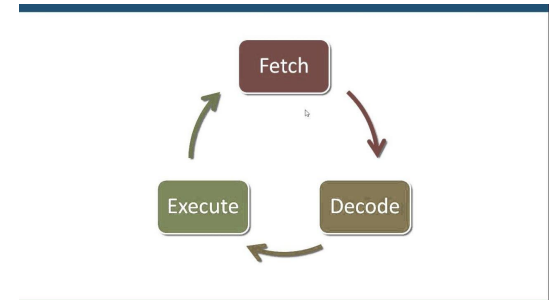

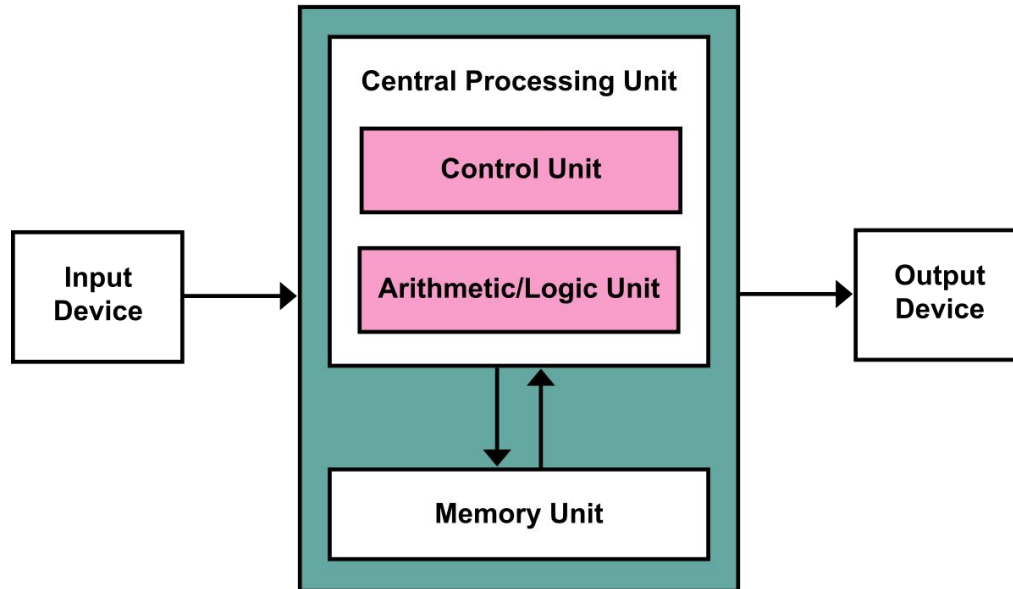

the intimate relationship between military requirements and the origins of computing

In 1944, von Neumann joined the Eckert-Mauchly ENIAC group at the University of Pennsylvania. At that time he was involved in the

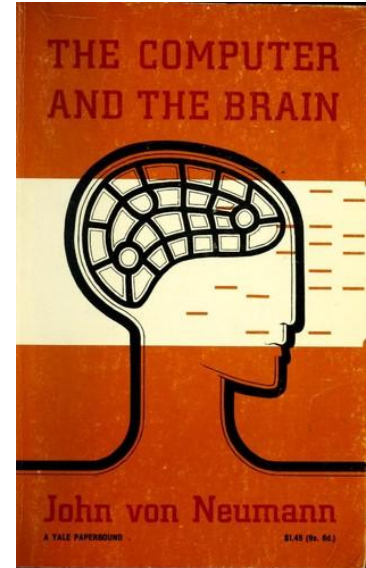

Manhattan Project at Los Alamos, where roomful of clerks armed with desk calculating machines were struggling to carry out the massive calculations required by the physicists.)

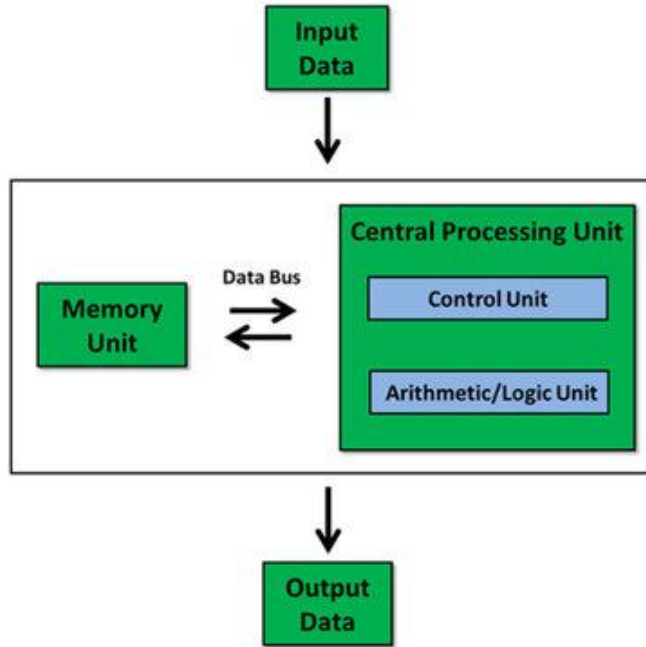

Von Neumann's most lasting contributions to the field of computer science are with two foundational concepts used in every computer running today: von Neumann architecture and the stored-program concept. (1945)

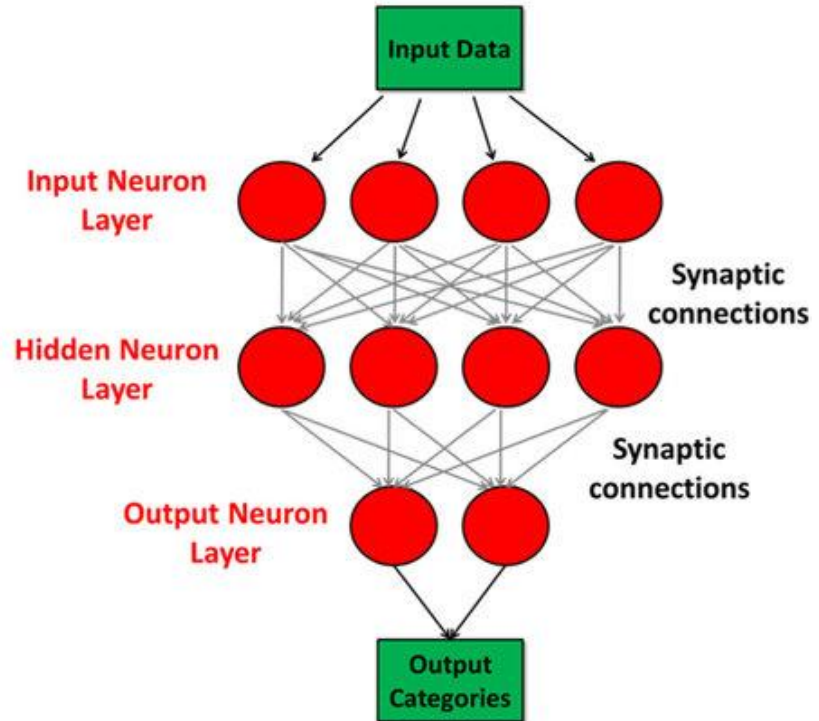

Metaphors and Science: Are Brains like Computers?

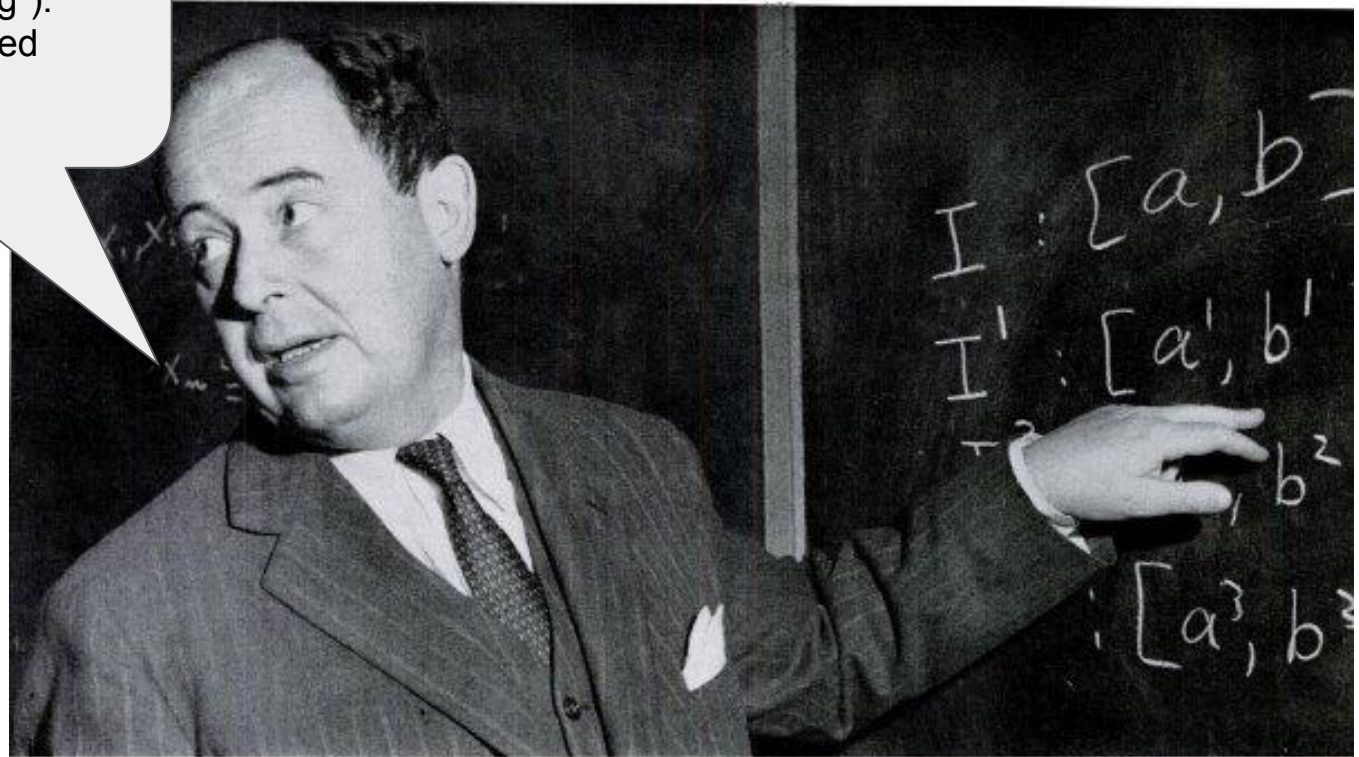

Von-Neumann architecture

Neuromorphic architecture

Understandingly, you love to hear about my accomplishments, but now I have to go and do some work. ("Giting", and "Javing"). Thank you for you undivided attention!

IMPARTING HIS MATHEMATICAL INSIGHT TO STUDENTS, VON NEUMANN FILLS BLACKBOARD WITH SYMBOLS AS HE OUTLINES THE SOLUTION OF A PROBLEM.
